

AI USE EXPLANATION

During the development of this project, our team used several AI tools to support the workflow and ensure academic transparency. All AI usage was strictly controlled, used only as a reference, and did not replace the team's own thinking, analysis, or implementation.

1. Using AI to Support Code Development

Our team used ChatGPT to generate code.

AI assisted in:

- Creating example code for training models (LSTM, GRU, Random Forest...).
- Suggesting functions for data preprocessing.
- Create graphs of models,
- AI suggests which methods to use to maximize results,
- Error handling,
- Dataset construction,
- Testing and debugging,

But the main idea, like model training conditions or dataset, is still provided by my team.

2. AI-generated content and grammar checker.

The report is checked for grammar using Grammarly.

- help our team improve writing skills and enhance text quality,
- check and correct spelling, grammar, and punctuation errors in English texts.

The entire report content was checked using GPTZero to:

- Detect whether any part of the text appears AI-generated.
- Ensure that no percentage of content in the report is generated by AI.

My team will check on GPTzero if there is any part written by ChatGPT that will be rewritten in our way, then verified on GPTzero again.

3. Checking with Turnitin

Our team used Turnitin to:

- Check our report for plagiarism from online sources.

- Ensure the report maintains a low similarity score according to the instructor's requirements.
- check to see if any part needs to be rephrased in our own words

There will always be references from external data sources, but the data will be filtered to match the dataset and the original direction the group has set out.

4. Principles of Ethical and Transparent AI Usage

The team followed these principles:

- AI does not directly influence decisions in my team and is just a suggestion and reference tool.
- No content will be copied directly from AI.
- All AI-suggested text was rewritten, restructured, and refined using our own reasoning.
- All final content was verified using GPTZero and Turnitin before submission.

Conclusion

Selective, appropriate use of AI is only supported in accelerating project development, providing ideas, and assisting with plagiarism checking and AI-generated content
